

Claims

I claim:

1. A trade show booth security apparatus for protecting and safeguarding a trade show booth comprising:

a section of material having two sides wherein said section of material is comprised of Kevlar and is 116 inches in length and 94 inches in height;

a plurality of fastening members for fastening said material to a trade show booth support structure each comprising a handle portion for holding said fastening members, a hooked portion for grasping an edge of said support structure and a tightening member that works in conjunction with said hooked portion to hold said edge of said support structure and wherein said tightening member is configured for opening by hand without the use of a tool and wherein said fastening members being made of metal;

a plurality of hanging members comprising a hanging portion configured for hanging from a cross bar of a trade show booth support structure and a projection having an end, said end adapted for removable connection to a lifting device;

a plurality of attachment members wherein each of said plurality of attachment members consists of at least one metal ring and a leather strap in a loop fixed to said material and attached to one of the plurality of fastening members;

a plurality of additional attachment members wherein each of said plurality of additional attachment members consists of at least one leather ring and a leather strap in a loop fixed to said material and attached to one of the plurality of hanging members;

an access means comprising a belt, a lock and a zipper, said zipper being vertically and centrally disposed in said material and wherein said belt and lock together secure said access means when said zipper is in a closed position;

wherein each of said fastening members are constructed for attachment to said trade show booth support structure in a manner to permit fastening and unfastening from one side of said material when fastening members are attached to said trade show booth support structure with the section of material; and

wherein said tightening member comprises a circular finger hold for loosening and tightening said tightening member by hand; and

whereby contents of said trade show booth are substantially hidden from an exterior of the booth and the contents are secured when the security apparatus is applied to the trade show booth.
